Systems with open boundaries that exchange matter with the exterior are the most common in nature and technology. For theoreticians and simulators, the proper description of this exchange is a challenging task, in particular, for many electron systems.

This course deals with the application of structure and theory to the study of organic reaction mechanisms: Stereochemical features including conformation and stereoelectronic effects; reaction dynamics, isotope effects and molecular orbital theory applied to pericyclic and photochemical reactions; and special reactive intermediates including carbenes, carbanions, and free radicals.
