The gravity model of international trade in international economics is a model that, in its traditional form, predicts bilateral trade flows based on the economic sizes (often using GDP measurements) and distance between two units.. The model was first introduced in economics world by Walter Isard in 1954. The basic model for trade between two countries (i and j) takes the form of

Definition. A VAR model describes the evolution of a set of  $k$  variables (called endogenous variables) over the same sample period ( $t = 1, \dots, T$ ) as a linear function of only their past values. The variables are collected in a  $k \times 1$  vector  $y_t$ , which has as the  $i$ th element,  $y_{i,t}$ , the observation at time " $t$ " of the  $i$ th variable. For example, if the  $i$ th variable is GDP, then  $y_{i,t}$  is the ...
