

design of portal frame pdf

Single-span steel portal frames are a common form of construction for single-storey buildings in the UK, but there is relatively little published guidance on the design of such structures. This publication concentrates on the design of portal frames using hot rolled steel sections rather than fabricated members.

Part 4: Detailed Design of Portal Frames 4 - vii SUMMARY This publication provides guidance on the detailed design of portal frames to the Eurocodes. An introductory section reviews the advantages of portal frame construction and clarifies that the scope of this publication is limited to portal frames without ties between eaves.

PLASTIC DESIGN OF PORTAL FRAMES Introduction This section covers a number of features of plastic design of portal frames to BS 5950-1. The frame is analysed plastically allowing the formation of plastic hinges, which can rotate to allow the redistribution of bending moments. The frame is then designed in a similar way to a frame analysed elastically.

For the design of portal frames, plastic methods of analysis are mainly used, which allows the engineer to analyse frames easily and design it economically. The basis of the plastic analysis method is the need to determine the load that can be applied to the frame

design methods for steel portal frames (e.g. geometrically and materially nonlinear analysis with imperfections or GMNIA, and the general method introduced in Eurocode 3), compared to the commonly used member checks with interaction formulae.

Advanced design and optimization of steel portal frames

The design of portal frames is well covered in BS 5950-1, supported by extensive guidance in other publications and commonly undertaken using bespoke software. The new national Standard BS EN 1993-1-1 does not contain such extensive (and UK-
